

## Feedback

### **(a) Do you understand the other team's three high-level interactions?**

Yes! The first visualization compares three different categories in a bar chart by selecting total/avg/max/min. The second one is tracking the seasonality of the moth species in a time trend line graph.

### **(b) Do you believe the other team's proposed design supports all three high-level interactions?**

Yes, they have:

- Sorting total/avg
- Scrolling through different times
- Filter by species stations

### **(c) Does the team's sketch include appropriate data-visual mappings and meet the final requirements listed in milestone 1?**

It should work, but they mentioned that due to data disparity and issues, it may be hard to do the second visualisation. Overall, we think it is possible if they remove the dates where there is no data or treat N/A situations.

### **(d) What part(s) of the other team's design do you like most?**

I like the line graph because you can see the different species trends visually and compare/contrast them easily.

### **(e) What suggestions do you have for improvement? Record your feedback so that you can hand it in as evidence that you completed this part of the milestone.**

For the second graph, since moth sightings will differ by lunar phase, you could show the bias/uncertainty created over a period of time, just so the data is accurate. You could also filter by the moth's population. Also, try to account for the photo amount disparities if you have time.

## Feedback

(a) Do you understand the other team's three high-level interactions?

Yes, we understand the high-level interactions this team has. It includes being able to change the scope of the first map to a single state via a zoom in/out function

You can also hover on a single spot on the map to get more information on the supplier in that area

In the second map, you can also sort the sankey map by A-Z lowest to highest budget, etc.

(b) Do you believe the other team's proposed design supports all three high-level interactions?

Yes!

(c) Does the team's sketch include appropriate data-visual mappings and meet the final requirements listed in milestone 1?

Yes!

(d) What part(s) of the other team's design do you like most?

I like the sankey visualization choice!

(e) What suggestions do you have for improvement? Record your feedback so that you can hand it in as evidence that you completed this part of the milestone.

When you zoom in on the map in the first visualization, it would be nice if the data points were more dispersed to show more specific regional information
